

SALESFORCE DELIVERY MANAGEMENT

Full Project Report & Implementation Guide

Customers • Shipments • Delivery Agents • Delivery Updates • Locations • Dashboard

Platform	Salesforce Lightning Experience
Environment	Developer Edition / Development Org
Project	Delivery Management
Dashboard	Delivery Management Dashboard
Report Date	29 September 2026
Purpose	Configuration, reporting, dashboard and troubleshooting guide

This report is based on the Salesforce delivery-management requirements and the issues discussed in the project, including missing customer/shipment records, Delivery Agent navigation, Delivery Updates, and Location configuration.

1. Executive Summary

The project objective is to configure a Salesforce Lightning application for end-to-end delivery operations. The solution should support customer management, shipment creation and assignment, delivery-agent management, delivery updates, location capture, operational reports, and a management dashboard.

The main issues observed were that customers and shipments were not appearing, the Delivery Agent item was difficult to locate, Delivery Updates did not contain shipment records, and Location configuration was not visible. These symptoms commonly result from missing records, incorrect relationships, navigation settings, permissions, page layouts, or report filters.

Recommended principle: build and validate the data model first, then verify records and relationships, then create reports, and finally build the dashboard. A dashboard should never be used as the first place to diagnose missing data.

2. Project Objectives

#	Objective	Expected Result
1	Customer Management	Customers can be created, viewed, searched and reported.
2	Shipment Management	Shipments are linked to the correct customer.
3	Delivery Agent	Agents are available in navigation and can be assigned to shipments.
4	Delivery Updates	Updates are recorded against existing shipments.
5	Location	Location information can be captured and displayed.
6	Reporting	Operational reports return the correct records.
7	Dashboard	Management sees key delivery KPIs in one place.

3. Recommended Data Model

Use a simple relational model. Exact Salesforce object labels may differ, but the logical relationships should remain consistent.

Object	Key Fields	Purpose / Relationship
Customer	Name, Phone, Email, Address	Parent/business party for shipments.
Shipment	Shipment No., Customer, Status, Pickup, Delivery, General	Operational record.
Delivery Agent	Name, Phone, Status	Person responsible for delivery.
Delivery Update	Shipment, Status, Date/Time, Remarks, Location	History/activity against an existing shipment.
Location	Address and/or latitude/longitude	Pickup, delivery or current-location information.

Core relationship: Customer → Shipment → Delivery Agent. Delivery Update should reference an existing Shipment. Location should be associated with the appropriate operational record rather than being used to create duplicate shipments.

4. Salesforce Configuration Procedure

4.1 Verify Objects and Fields

Open Setup and confirm that Customers, Shipments, Delivery Agents, Delivery Updates and Locations exist. For each object, verify required fields, field types, relationships, page layouts and field-level security.

4.2 Configure Lightning Navigation

Open App Manager, edit the relevant Lightning application, and add the required objects under Navigation Items. Recommended items are Customers, Shipments, Delivery Agents, Delivery Updates, Locations, Reports and Dashboards.

If Delivery Agent does not appear: verify the exact object/tab label, object availability, tab visibility and user permissions. The object may exist under a different label.

4.3 Create Verified Test Data

Record Type	Minimum	Purpose
Customers	3	Validate customer list and reports.
Delivery Agents	2	Validate assignment and navigation.
Shipments	5	Provide enough records for testing.
Delivery Updates	2–3 per shipment	Validate history and status reporting.
Locations	2+	Validate location capture/relationships.

5. Troubleshooting Guide

5.1 Customers Are Not Displaying

Confirm customer records exist. Then check object Read permission, tab visibility, list-view filters, report filters and record sharing. Open the Customer object directly and select the broadest available list view such as All.

5.2 Shipments Are Not Displaying

Open the Shipment object directly and confirm records exist. Open one shipment and verify its Customer relationship is populated. A report filter based on a related Customer field can exclude records when the relationship is blank.

5.3 Delivery Updates Must Not Create New Shipments

Correct workflow: open an existing Shipment → create Delivery Update → select the existing Shipment → enter status/date/location/remarks → save. Do not create a new Shipment merely to record a status change.

5.4 Delivery Agent Is Not Available

Check Setup → Object Manager for the exact object label and tab. Then check App Manager → Lightning App → Navigation Items. Verify object permissions and tab visibility for the current user.

5.5 Location Setting Is Not Visible

Determine whether the project uses a Salesforce Location field, Address fields, Geolocation fields, or a separate Location object. Then verify Object Manager → Fields & Relationships, field-level security, page layout assignment and Lightning Record Page visibility.

6. Report Design

Build and validate source reports before creating dashboard components. Every dashboard component should use a report that already returns the expected records.

Report	Primary Filter	Output
Customer Master	Active/all customers	Name, phone, email, address
Shipment Status	All shipments	Shipment, customer, agent, status, dates
Pending Delivery	Pending / Out for Delivery	Current workload
Delivered Shipments	Delivered	Completed deliveries
Agent Performance	Grouped by agent	Assigned and delivered counts
Delivery Update History	All updates	Shipment, status, time, location, remarks
Location Report	Relevant location records	Location and linked activity

7. Dashboard Design

Recommended dashboard components for management and operations are listed below.

Component	Type	Purpose
Total Customers	Metric	Active customer count
Total Shipments	Metric	Overall shipment volume
Pending / Out for Delivery	Metric	Current workload
Delivered	Metric	Completed deliveries
Shipment Status	Donut/Bar	Status distribution
Agent Performance	Bar	Shipments by agent
Delivery Trend	Line	Deliveries over time
Recent Delivery Updates	Table	Latest operational activity

Dashboard validation rule: if a component is empty, open its source report first. If the source report is empty, fix records, relationships, permissions or filters. Do not troubleshoot the dashboard component before the report is correct.

Dashboard Reference

The project dashboard is the Salesforce Lightning Dashboard link supplied in the project conversation. Access depends on the user's Salesforce login and permissions.

8. End-to-End UAT Checklist

Test	Expected Result	Status
Open Lightning application	Application loads correctly	■
Open Customers	Customer records are visible	■
Create customer	Record saves and appears	■
Open Delivery Agents	Agent object/list is visible	■
Create agent	Agent saves successfully	■
Create shipment	Shipment is linked to customer	■
Assign agent	Existing agent can be selected	■
Create delivery update	Update links to existing shipment	■
Add location	Location saves and displays	■
Run reports	Expected records are returned	■
Open dashboard	All components show expected data	■

9. Security & Access Checklist

Area	Verification
Object permissions	Read/Create/Edit access for required objects
Field-level security	Required relationship, status, date and location fields visible
Tab visibility	Required object tabs available
Record access	Sharing/ownership does not hide records
App navigation	Required objects included in Lightning app
Report folder access	User can access source reports
Dashboard access	User can open dashboard and source reports

10. Implementation Sequence

Phase 1 – Foundation: Confirm objects, fields, relationships, permissions and navigation.

Phase 2 – Data: Create verified customer, agent, shipment, update and location records.

Phase 3 – Operations: Validate shipment assignment and delivery-update workflow.

Phase 4 – Reporting: Build and test source reports.

Phase 5 – Dashboard: Add dashboard components using validated reports.

Phase 6 – UAT: Execute the full testing checklist.

Phase 7 – Handover: Document user procedures and maintenance.

11. Final Recommendation

The most reliable implementation sequence is **Objects → Fields → Relationships → Permissions → Records → Reports → Dashboard**. This prevents the common problem of trying to fix a dashboard when the underlying records or relationships are missing.

For the current project, the priority is to verify Customers and Shipments first, expose Delivery Agent in the Lightning navigation, ensure Delivery Updates reference existing Shipments, and then configure Location. Once those items are validated, the dashboard can be populated reliably.

12. Completion Criteria

The project is complete when required objects are accessible, test records are visible, shipments are linked to customers and agents, delivery updates are recorded against existing shipments, location information is available, source reports return correct data, and the dashboard displays the expected KPIs and operational charts.
